Documentation for Showroom Tool v.0.9

By Jacob Brandt-Møller, hulemalerier.dk

This tool is free to use. Any donations on the website are welcome and feel free to add a link back to http://www.hulemalerier.dk if you decide to use this Showroom Tool.

This version comes with the following files:

- **showroom.html**
- **showroom.json**
- **showroom.js**
- **sofa.jpg**

Paintings (for example only):

- **akryl96.jpg – akryl108.jpg**
- **akryl96_lille.jpg – akryl108_lille.jpg**

If you copy all the files into your website files directory, it should work directly as is, with the example paintings.

You can customize the Showroom Tool however. Here comes a description of the different files and how to change them to meet your need:

showroom.html:

```
<!DOCTYPE html>
<html>
        <head>
                <title>Showroom</title>
                <meta http-equiv="Content-Type" content="text/html; charset=UTF-8">
                <script src="http://ajax.googleapis.com/ajax/libs/dojo/1.6/dojo/dojo.js"></script>
                <script type="text/javascript" src="showroom.js"></script>
        </head>
        <body onload="init()">
                                <div id="showroom"></div>
        </body>
</html>
```

This is the html file that opens the showroom and presents it.

The presentation of the showroom is fixed at the top left of the screen in this version.

The <div id="showroom"></div> is the area where the showroom will be inserted.

I'm using google's dojo.js file, but if you have your own version of dojo 1.6, you can link to that one instead.

showroom.json

```json
{
    "Paintings": [
        {
            "Year": 2012,
            "Src": "akryl96",
            "Title": "The Bridge",
            "Height": 70,
            "Width": 50,
            "Price": "$3000"
        }, {
            "Year": 2012,
            "Src": "akryl97",
            "Title": "Window of Freedom",
            "Height": 60,
            "Width": 50,
            "Price": "$3000"
        }

    ]

}
```

I only included 2 of the paintings shown in the showroom.json example.

It is **very** important that the json file is formatted correctly. If you have made changes and you are not sure if it's formatted correctly, you can use an online json validator like http://jsonlint.com to check it.

```
"Year": 2012,          - the year of the painting
"Src": "akryl96",      - filename (*)
"Title": "The Bridge", - title of the painting
"Height": 70,          - height in cm
"Width": 50,           - width in cm
"Price": "$3000"       - price
```

(*) About the filename: The extension and thumbnail name will be added automatically. That is why the files has to be of type .jpg and there needs to be a filename_lille.jpg thumbnail in the same location as the file.
